

Citizen

- what should be visual (UI/UX) to the user?
- How to confirm the user did it correctly?
- How to ensure they get the benefits after completion.

Cloud (the infrastructure)

- What kind of data (from MCU) to use and utilise?
- What kind of (external) data to use? How to implement them?
 - Map / satellite image
 - Weather forecast
 - (what else?)
- How to process the MCU and external data together to build the estimation/predication of when and how much the plant need watering.
 - How to utilise AI for that? do we need AI?

Government

- How to implement (UI/UX) the Admin/Main Monitor Dashboard? Previlage?
- (still not fully visioned yet)

MCU

- What kind of power source to use? battery, solar/wind-source, etc.
- Where to install/mount the MCU? (in the ground, on the tree, etc?)
- How to configure/identify the tree? such as location, and type of plant (to identify the frequents to water it).
- What kind of (Wireless) communication do we need to use? (WIFI, BLE, LoRaWAN, etc.)
- List

Others

- How to identify the health of the try?
- How to know it get watered? Like is there a way to read data from the steam of the plant?
- can we get energy from soil? any cutting-edge way?
- How many MCU per plant? can it be possible multiple plants get same MCU?
- List

Sensor

- What (type of) sensors do we need to use?
- Where to install the sensor(s)?
- How to connect/install the sensor(s)?
- What data do we need to measure?
- How to ensure plant get water? (reading data)
- How often do we need to get data from sensor(s)?
